

2013 Hurricane Season Guide

Plan, Act, Survive!

Last Updated: Aug 7, 2013

National Weather Service
Charleston, SC
weather.gov/chs

Welcome to the **2013 Hurricane Season Guide** from your National Weather Service in Charleston, SC!

HURRICANE HUGO

This guide will help you learn:

- how to prepare for hurricane season
- how to stay informed of the latest tropical cyclone threats
- how to stay safe during a hurricane
- tropical cyclone **basics**/climatology
- local tropical **cyclone history**

NOTE: Numerous links (in blue) are provided throughout this guide for more information!

Outline

- **Tropical Cyclone Hazards**
- Being Prepared and Staying Informed
- Tropical Cyclone Basics
- Tropical Cyclone Climatology
- Tropical Cyclone History for Southeast South Carolina and Southeast Georgia

Main Tropical Cyclone Hazards

Storm Surge

High Winds

Tornadoes/Waterspouts

Flooding

Storm Surge Terminology

- Storm surge: abnormal rise of water generated by a storm
- Storm tide: storm surge + astronomical tide
- Inundation: height of water above land (NOTE: will be the way the NWS describes the amount of water above the ground that could occur)

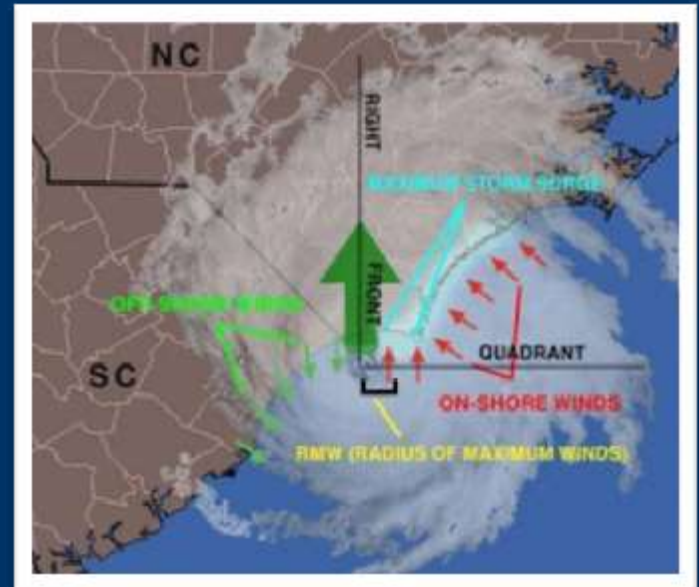

Storm Surge Facts

- Greatest threat to life and property along the coast
- Can travel many miles inland in low-lying areas (such as along the SC/GA coasts)
- Produced mainly by strong winds blowing over the ocean for an extended period
- Generally, stronger/larger/slower storms produce higher surge
- Highest surges typically occur just to the right of where the center of the storm comes ashore (blue area outlined in the image to the right)

Isle of Palms, SC after Hurricane Hugo

Storm Surge Facts

- Greatest surge may not occur at the time of the highest tide, thus lessening the amount of water above land (i.e., inundation)
- SC/GA coast is the 3rd most surge-prone area in the U.S.
- In 1989, Hurricane Hugo produced ~20 foot storm tide (above Mean Sea Level) around Bulls Bay, SC and ~10 foot storm tide (above Mean Sea Level) in Charleston, SC

« Images courtesy of NWS

Romain Retreat, SC (near Bulls Bay) after Hugo

The Battery in Downtown Charleston, SC after Hugo

Storm Surge Impacts

Folly Beach, SC – before Hugo

Folly Beach, SC – after Hugo

Hurricane Ivan (2004):
- Category 3; 10-16 foot surge

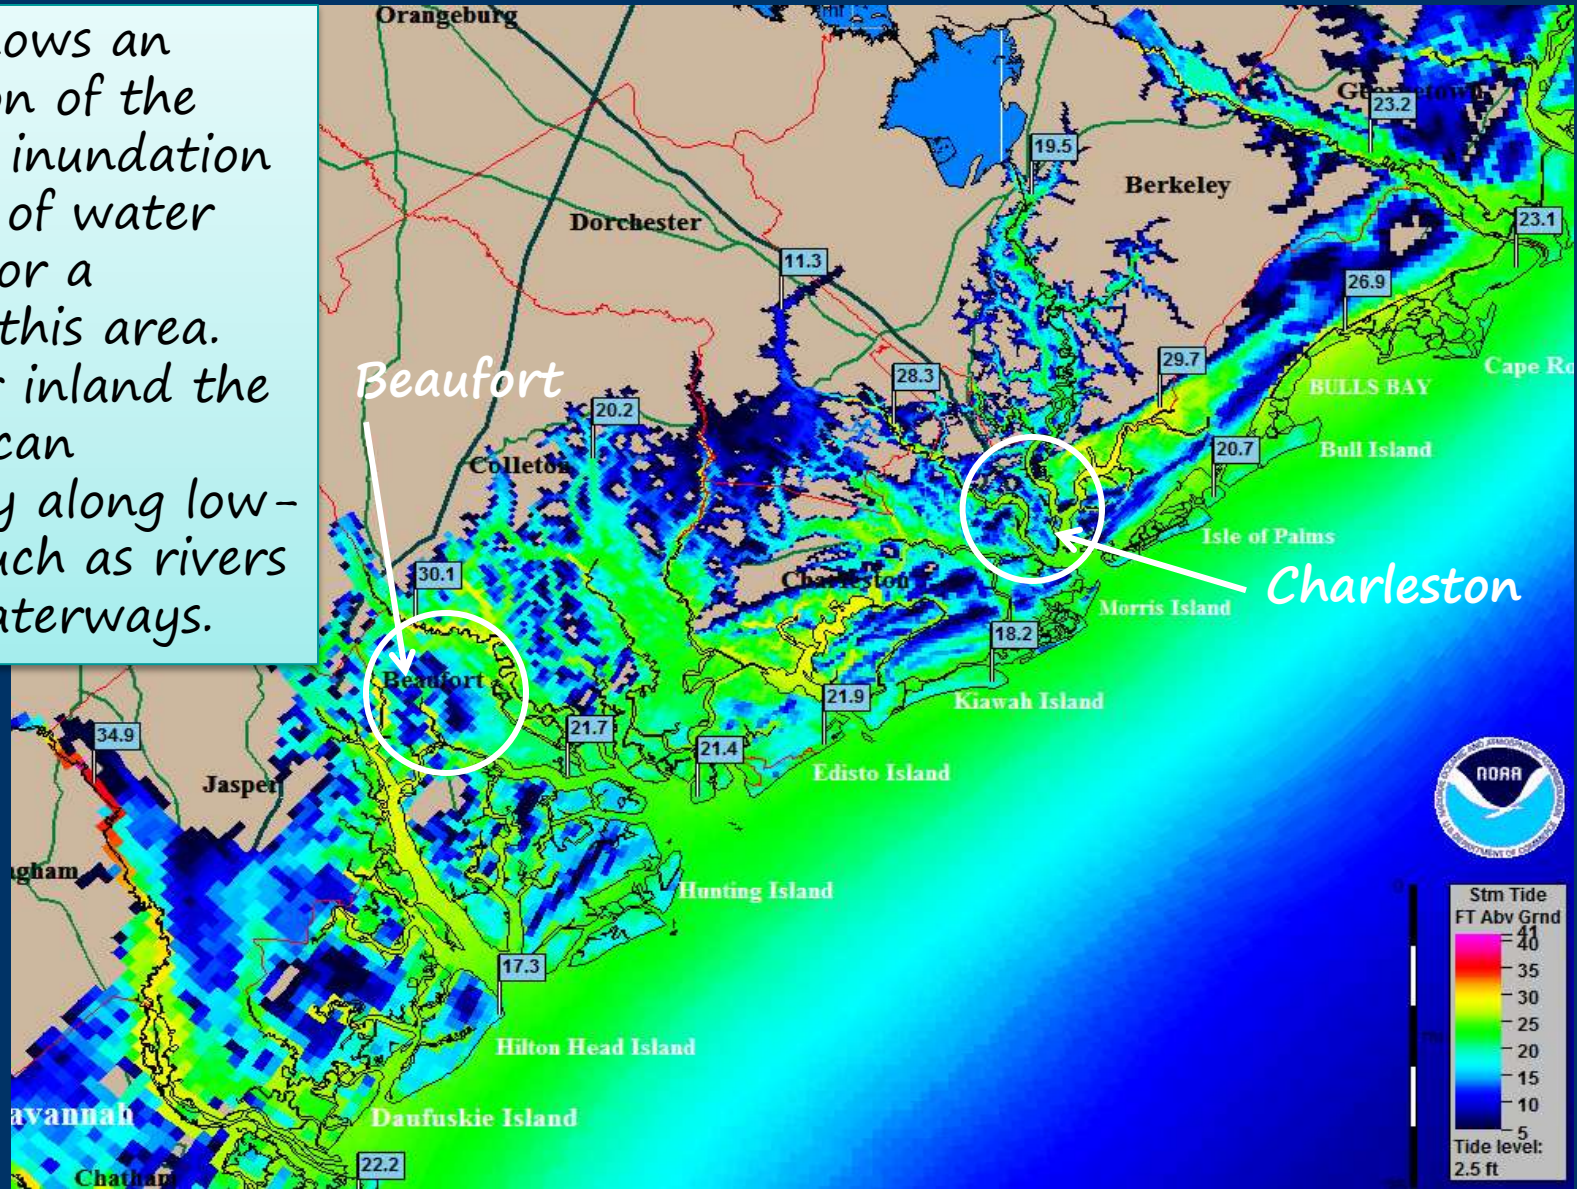

Hurricane Ike (2008):
- Category 2
- 15-20 foot surge

Local Storm Surge Risk

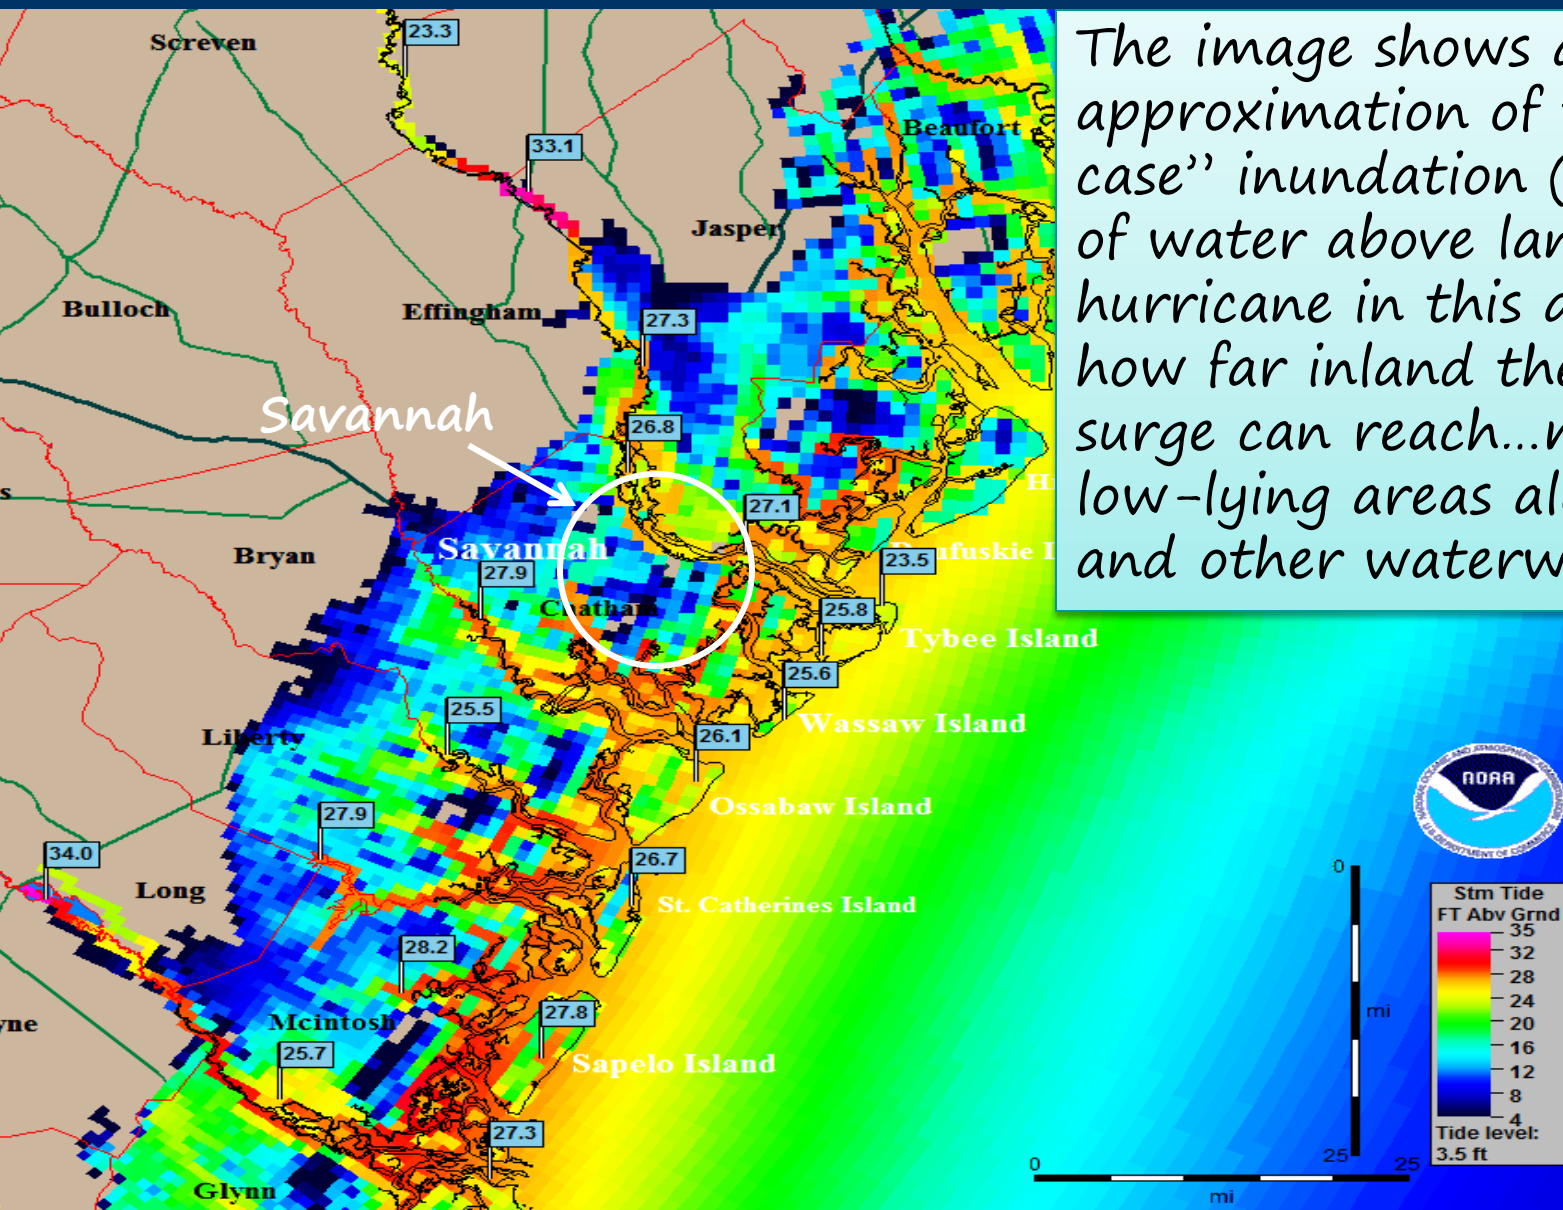

Southern South Carolina Coast

The image shows an approximation of the “worst case” inundation (i.e., amount of water above land) for a hurricane in this area. Note how far inland the storm surge can reach...mainly along low-lying areas such as rivers and other waterways.

Local Storm Surge Risk

Northern Georgia Coast

The image shows an approximation of the “worst case” inundation (i.e., amount of water above land) for a hurricane in this area. Note how far inland the storm surge can reach...mainly in low-lying areas along rivers and other waterways.

Are You At Risk From Storm Surge?

- Determine your elevation and whether you live in a flood zone (i.e., if you are vulnerable to storm surge flooding)
 - If you live in/near any of the shaded areas on the maps on the previous 2 slides you are vulnerable to storm surge!
 - Refer to your county emergency management office... [SC](#) / [GA](#)
- Learn which pre-designated evacuation zone you live in as well as official evacuation routes... [SC](#) / [GA](#)
- *Evacuate if advised to do so by authorities!*
- Keep in mind that if you don't evacuate your home/structure may become an "island" cut off from emergency officials

High Winds

- Strong winds can occur well inland away from coastal areas
- In fact, Hurricane Hugo in 1989 produced hurricane force wind gusts in Charlotte, NC toppling numerous trees and power lines (see images below)

High Wind Facts

- Coastal areas/high-rise buildings:
 - winds normally higher due to less surface friction
- Inland areas away from the immediate coast:
 - sustained winds generally lower than at coast, but gusts can be similar to sustained winds at coast

« Images courtesy of NWS

Charleston Area After
Hurricane Hugo (1989)

High Wind Safety

- Cover all windows and doors with plywood or shutters
 - Do NOT leave any windows/doors open to relieve pressure
 - Tape does NOT work!
- Reinforce garage doors
- Store all outdoor items that could become deadly missiles
- Evacuate to a more sturdy structure if you live in a mobile/manufactured home
- During a storm, go to your “safe place” which should be the most interior room on the lowest floor of your building that is not prone to flooding

Protect Windows & Doors from Flying Debris!

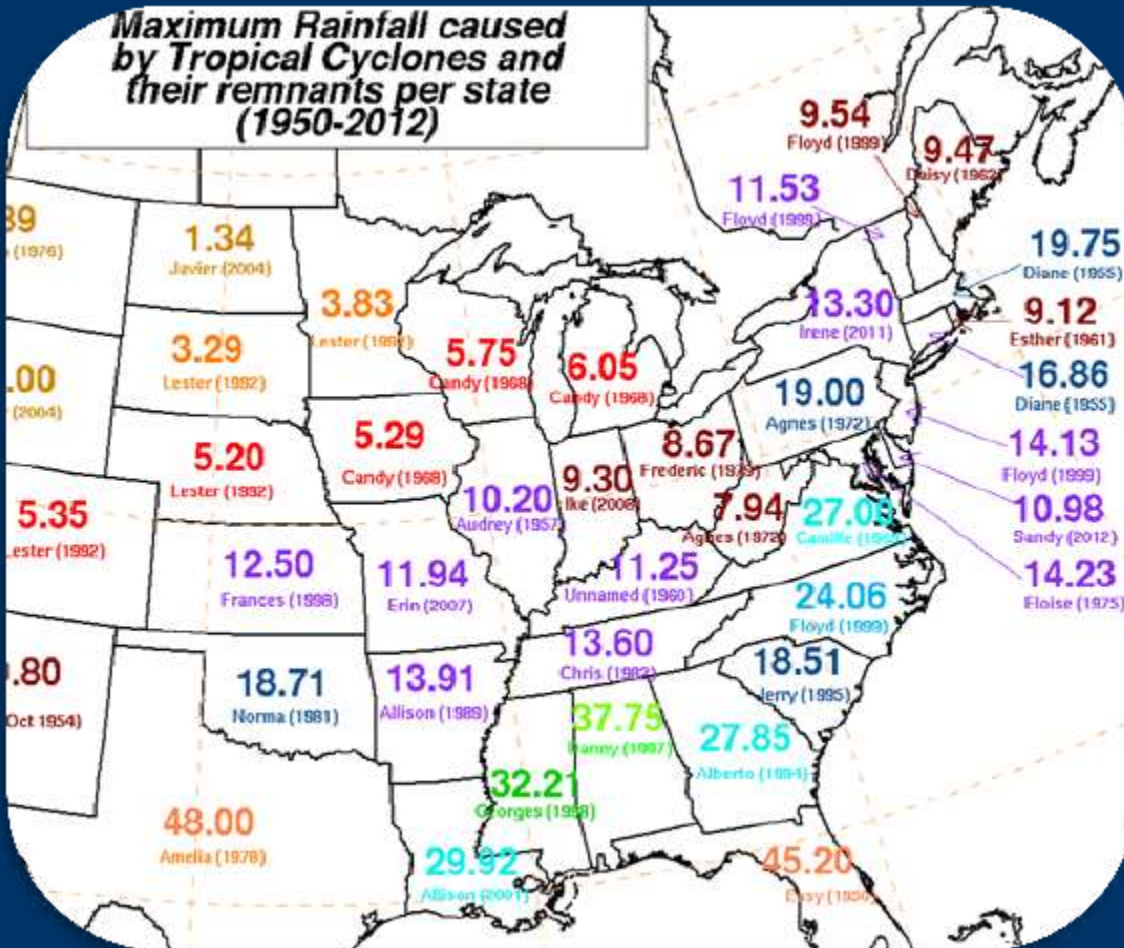

Heavy Rainfall/Flooding

- **When you think “hurricane”, think “flooding”!**
- Most deaths in tropical cyclones recently has been from inland/fresh water flooding
- Weak storms can still produce heavy rainfall
- The slower a storm is moving, the more rainfall it can produce
- Determine whether you live in a flood zone and evacuate if advised to by officials
- Never drive through flooded roads since you don't know how deep the water is and the road may be washed out

It only takes ~1 foot of water to move most vehicles!!

Heavy Rainfall/Flooding

« Images courtesy of
NWS/Weather Prediction Center

- The coastal areas of SC and GA, particularly in urban areas like downtown Charleston and Savannah, are particularly vulnerable to flooding given the added influence of the storm tides

Tornadoes/Waterspouts

- Typically short-lived (minutes) and weak (EFO-EF1: up to 110 mph), although can be much stronger
- Typically occur within the storm's outer rain bands and near the center (eye wall)
- During the storm, if the NWS issues a "Tornado Warning" or "Extreme Wind Warning" for your location, go to your "safe place" (most interior room on lowest floor not prone to flooding)

Outline

- Tropical Cyclone Hazards
- **Being Prepared and Staying Informed**
- Tropical Cyclone Basics
- Tropical Cyclone Climatology
- Tropical Cyclone History for Southeast South Carolina and Southeast Georgia

Before the Storm...

- Determine your elevation and whether you live in a flood zone (i.e., if you are vulnerable to flooding from storm surge)
 - If you live in/near any of the shaded areas on the surge maps found earlier in this guide you are vulnerable to storm surge!
 - Refer to your county emergency management office... [SC](#) / [GA](#)
- Learn which pre-designated evacuation zone you live in... [SC](#) / [GA](#)
- If you are [evacuating](#), find a hotel/shelter and learn evacuation routes
- Get a [disaster supply kit](#) that includes sufficient food and water
- Prepare your home by boarding up windows/doors with plywood and trimming trees and shrubbery
- Review your insurance policy (Note: flooding is not covered and must be purchased via the [National Flood Insurance Program](#) for which there is roughly a 30 day waiting period)
- Make plans for your pets since some shelters/hotels do not accept them

Remember...preparation is key!

If evacuating...leave early!!

Motorists Trapped on I-26 During Hurricane Floyd (1999)

An average size car will flip in 115 mph winds!

Tropical Storm/Hurricane Watch & Warning Definitions

➤ Watch:

- Tropical Storm/Hurricane force winds possible within 48 hours
- *Get Prepared!*

➤ Warning:

- Tropical Storm/Hurricane force winds likely within 36 hours
- *Take Action!*

If a Watch is Issued For Your Area...

- 
- The background of the slide features two blue signs. The top sign is oval-shaped with the words "EVACUATION ROUTE" in white capital letters. The bottom sign is rectangular with a white arrow pointing upwards. Both signs are slightly faded and overlaid with the text of the list.
- Determine whether you are vulnerable to flooding from storm surge... [SC](#) / [GA](#)
 - Learn which pre-designated evacuation zone you live in as well as official evacuation routes... [SC](#) / [GA](#)
 - Evacuate if you are advised to do so by officials, and do so early!
 - Review your [disaster plan](#) and check your [supply kit](#)
 - Prepare your home by trimming weak/dead branches, covering windows/doors and bringing in unsecured outdoor items
 - Inspect/secure mobile home tie downs
 - If evacuating, notify your friends/family and note that some shelters/hotels do not accept pets
 - Gas your vehicles and get cash since ATMs won't work w/o power
 - Store drinking water in jugs, bottles and clean bathtubs (1 gallon per person per day for at least 3 days)

If a Warning is Issued For Your Area...

- Rush protective actions to completion!!
- Evacuate as soon as possible, especially if advised to do so by authorities!
 - Notify friends/family of where you are going
 - Take your disaster supply kit with you
 - Unplug appliances and turn off electricity/main water valve
- If not evacuating...
 - Be sure you are not vulnerable to flooding... SC / GA
 - Ready your disaster supply kit
 - Turn your refrigerator/freezer to the coldest settings and keep closed as much as possible
 - Cover windows/doors and store outdoor items
 - Fill bathtubs and large containers with water for cleaning/flushing purposes in case clean tap water is unavailable
 - If power is lost, turn off major appliances to reduce power "surge" when electricity is restored

After the Storm...

- If you have evacuated, don't return home until notified by officials!
- Watch for downed trees/power lines, glass, nails, and other debris as well as snakes, insects and other animals
- Don't drive through flooded roads
- Don't run power generators indoors
- Help neighbors, especially the elderly
- Be patient as help may take several days!
- More recovery tips....

NWS Tropical Products/Services

National Hurricane Center

- Predicts formation/track of tropical cyclones

hurricanes.gov

NWS Charleston, SC

- Localizes the potential impacts for SE SC/GA

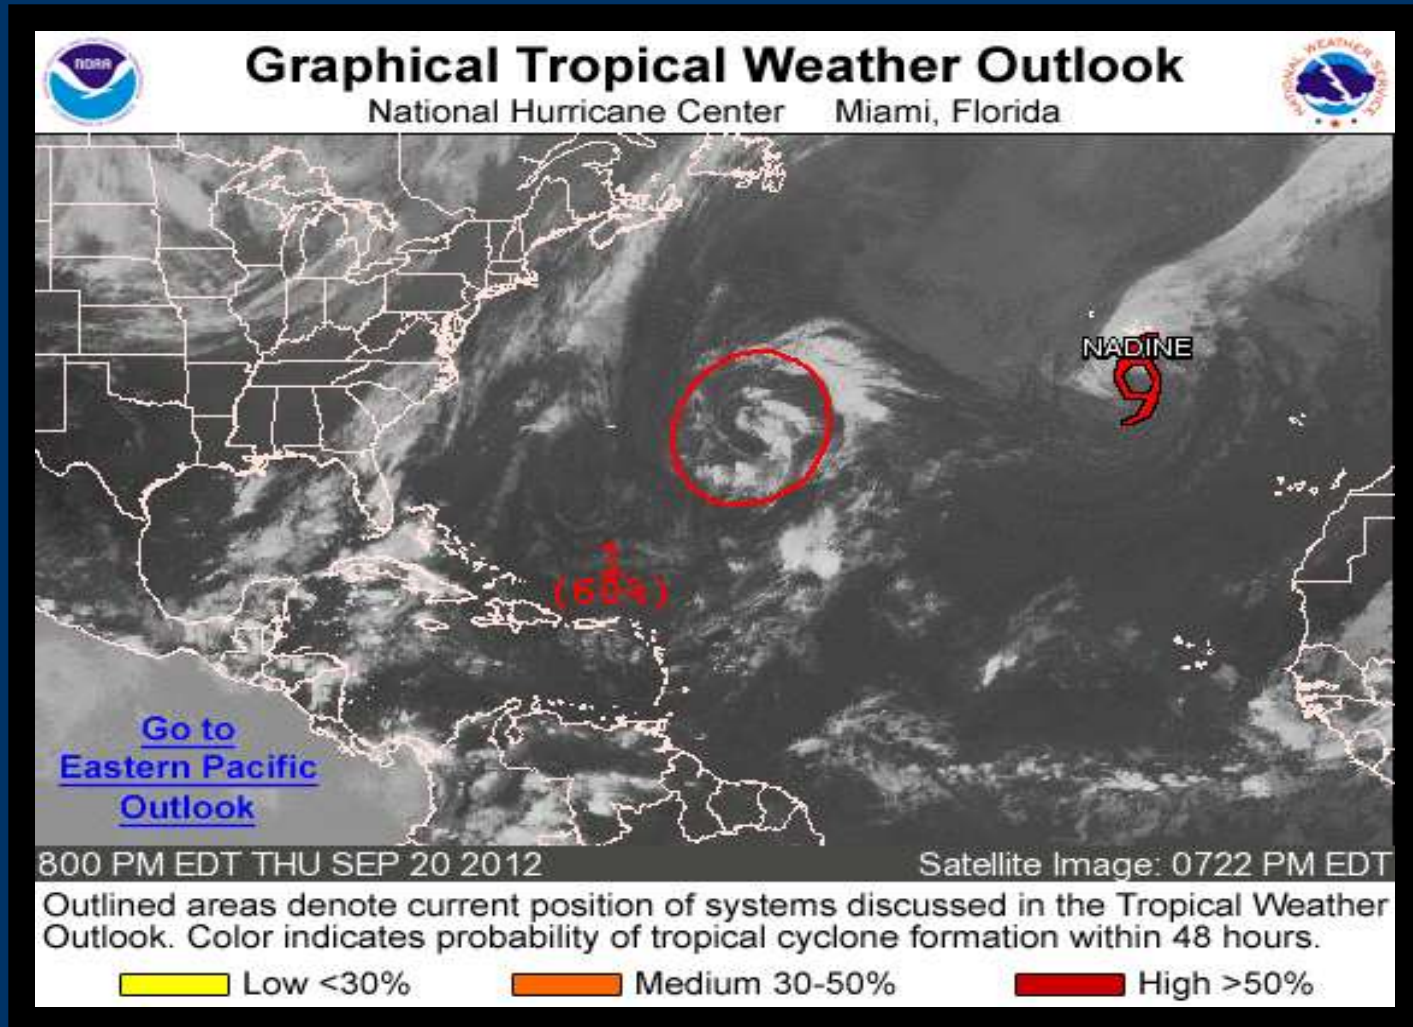

weather.gov/chs

NHC Tropical Weather Outlook

http://hurricanes.gov/gtwo_atl.shtml

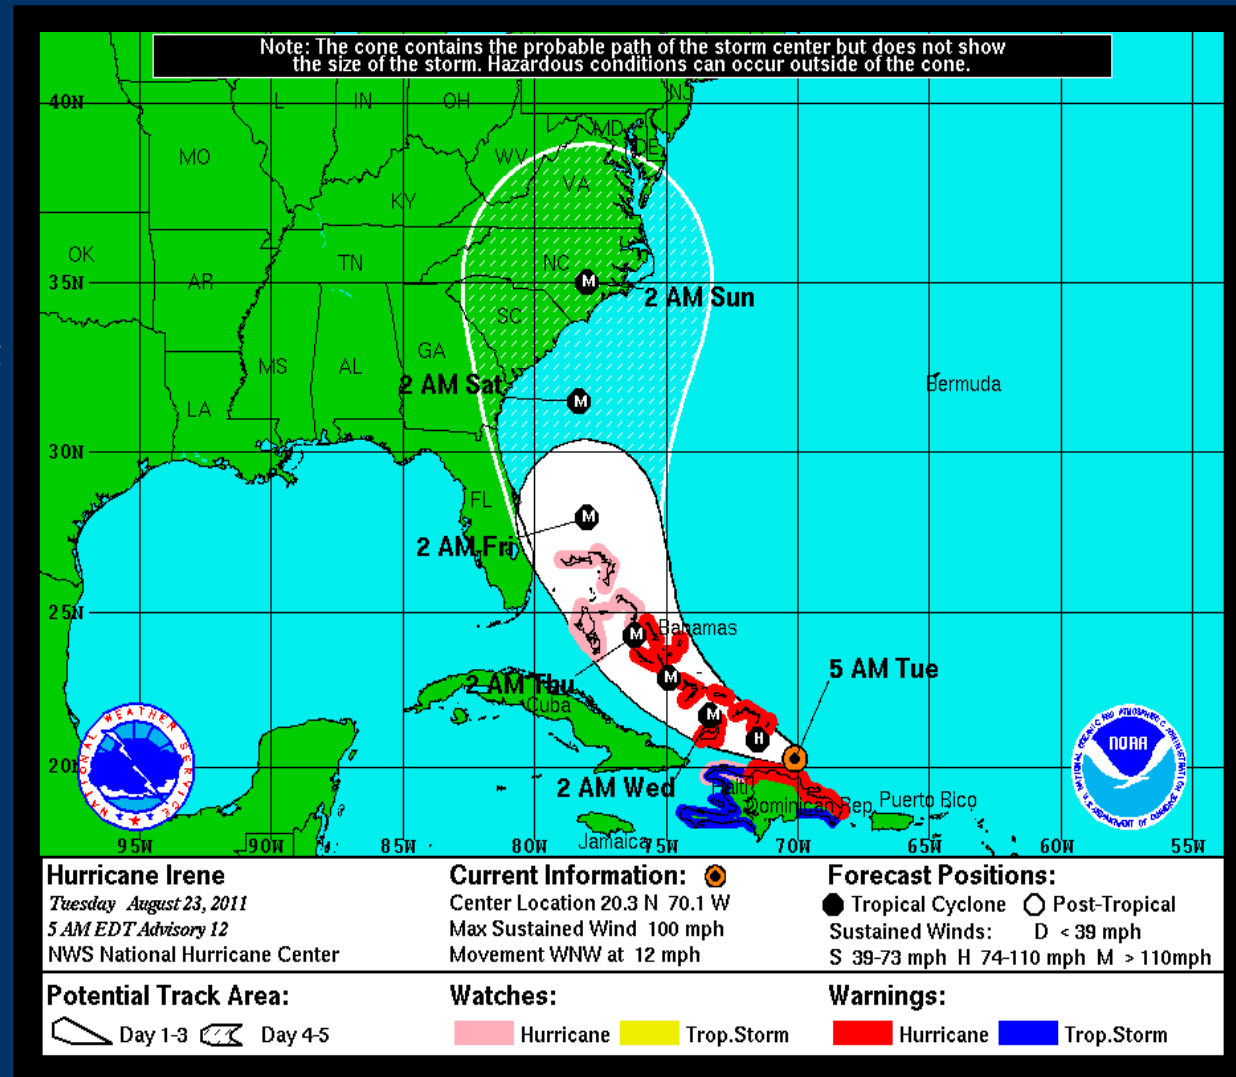

- Shows current storms and areas/probabilities of tropical cyclone development

- Note: This product will extend out 5 days by the end of 2013

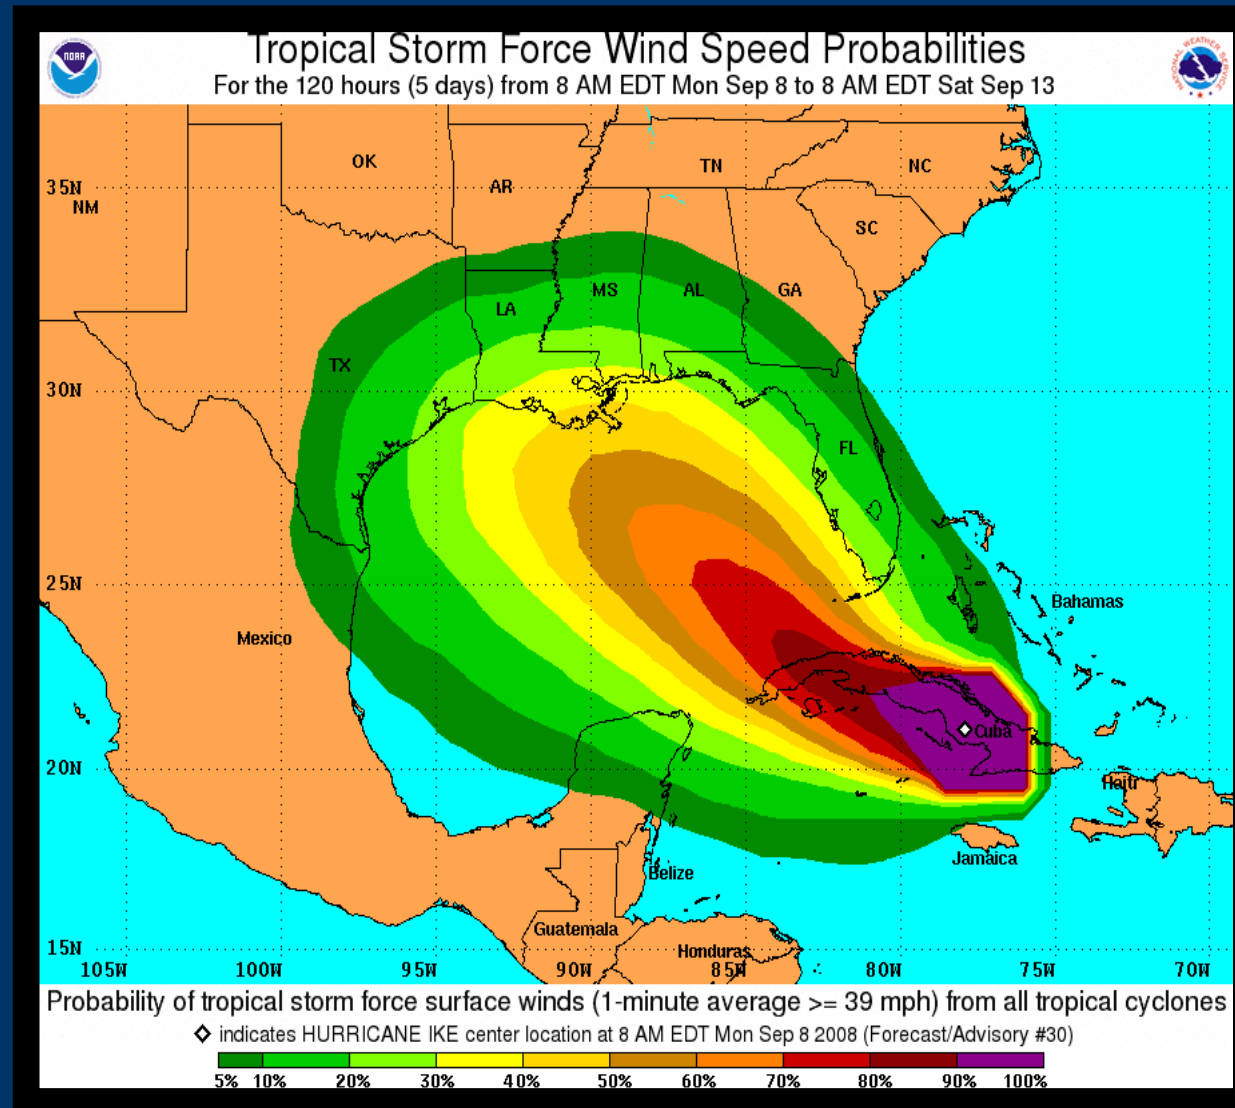

NHC Track Forecast “Cone of Uncertainty”

- Shows the likely storm track along with the latest tropical storm/hurricane watches and warnings
- It is important to remember that the “cone” does NOT indicate the area of possible impact, but rather just the track of the storm center!
 - For example, if the storm tracks on the edges of the “cone” there would be impacts outside of the “cone”!

NHC Wind Speed Probabilities

- Shows the chance of 34 knot (tropical storm force), 50 knot, and 64 knot (hurricane force) winds through the next 5 days, as well as during particular time periods
- Accounts for uncertainty in the storm's track/size/intensity
- **NOTE: Low probabilities do NOT necessarily imply low risk!**
- Product description:
 - <http://www.nhc.noaa.gov/aboutnhcgraphics.shtml#WINDPROB>

- The graphic above shows the probabilities of tropical storm force winds during the next 5 days

NHC Wind Speed Probabilities Example

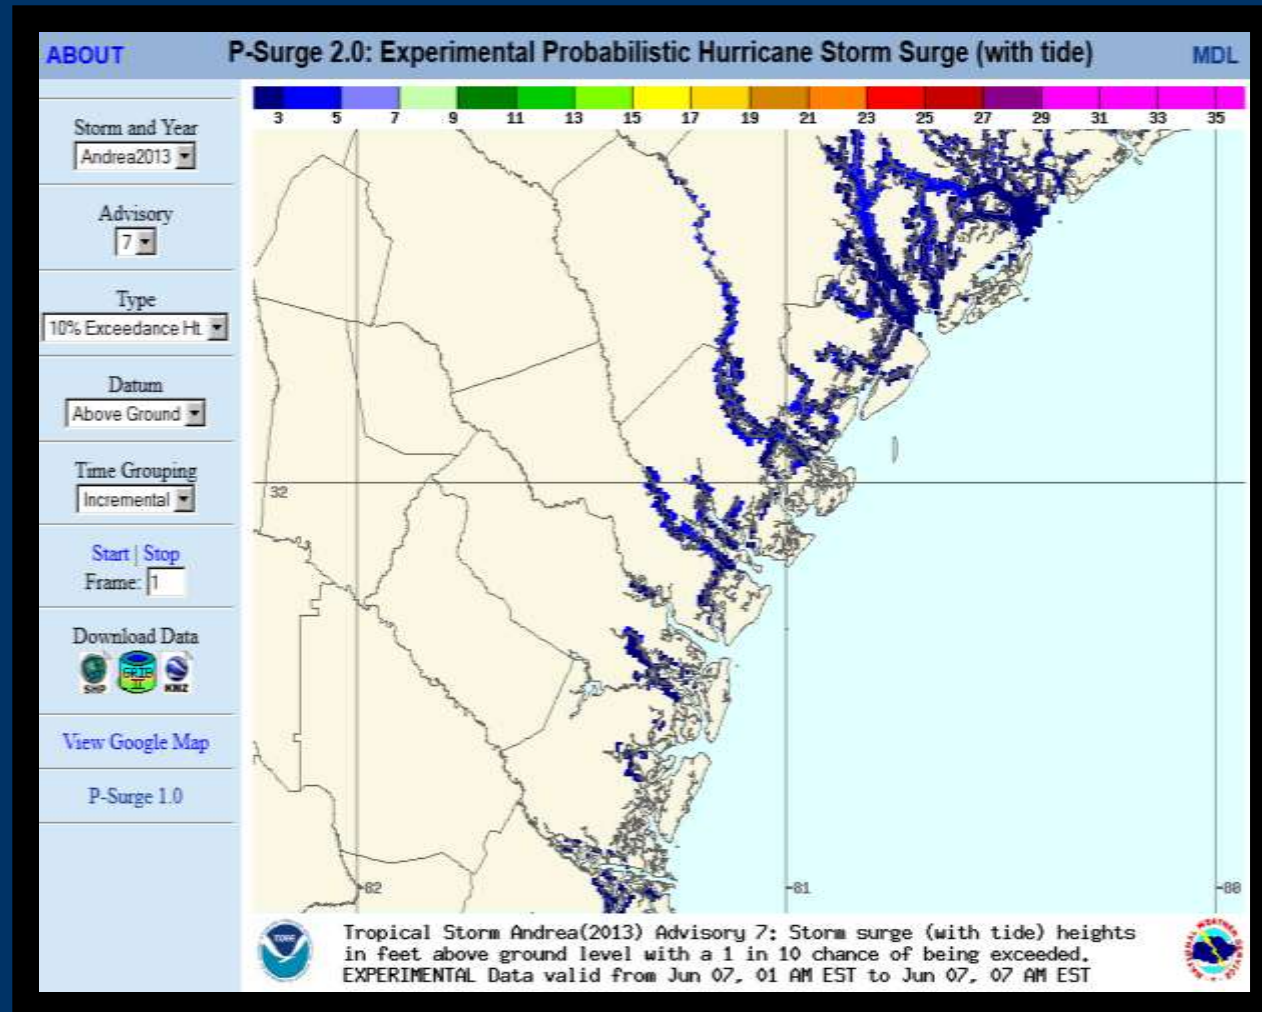

Forecast Hour	12	24	36	48	72	96	120
CHARLOTTE NC	34 X	X (X)	X (X)	X (X)	1 (1)	3 (4)	3 (7)
MOREHEAD CITY	34 X	X (X)	4 (4)	6 (10)	13 (23)	4 (27)	2 (29)
MOREHEAD CITY	50 X	X (X)	X (X)	X (X)	4 (4)	2 (6)	X (6)
MOREHEAD CITY	64 X	X (X)	X (X)	X (X)	1 (1)	1 (2)	X (2)
WILMINGTON NC	34 X	X (X)	4 (4)	4 (8)	6 (14)	4 (18)	1 (19)
WILMINGTON NC	50 X	X (X)	X (X)	X (X)	1 (1)	1 (2)	1 (3)
WILMINGTON NC	64 X	X (X)	X (X)	X (X)	X (X)	1 (1)	X (1)
COLUMBIA SC	34 X	X (X)	1 (1)	X (1)	X (1)	2 (3)	2 (5)
MYRTLE BEACH	34 X	1 (1)	3 (4)	2 (6)	4 (10)	2 (12)	1 (13)
CHARLESTON SC	34 X	2 (2)	3 (5)	X (5)	1 (6)	1 (7)	1 (8)
SAVANNAH GA	34 X	2 (2)	2 (4)	X (4)	X (4)	X (4)	1 (5)

- The probability for tropical storm force winds (34 kt) at Savannah, Georgia in the 12-24 hour time period is 2%, the cumulative probability through 48 hours is 4% and the cumulative probability for the entire 5-day period (120 hours) is 5%.

Storm Surge Inundation Probabilities

- Shows the potential for inundation (i.e., water height above land) resulting from a hurricane's storm surge (and tide)
- Accounts for uncertainty in a storm's track/intensity/size
- <http://www.nws.noaa.gov/mdl/psurge2.0/>

- The graphic above indicates the surge heights which only have a 10% chance of being exceeded

Hurricane Local Statement (HLS)

URGENT - IMMEDIATE BROADCAST REQUESTED
TROPICAL STORM ANDREA LOCAL STATEMENT
NATIONAL WEATHER SERVICE CHARLESTON SC
316 PM EDT FRI JUN 7 2013

...TROPICAL STORM WARNING CANCELLED FOR THE CHARLESTON COUNTY
COASTAL WATERS...

.NEW INFORMATION...
WARNINGS HAVE BEEN DISCONTINUED.

.AREAS AFFECTED...
THIS LOCAL STATEMENT OFFERS GUIDANCE AND RECOMMENDATIONS FOR
MARINERS...AS WELL AS OTHER MARINE INTERESTS...ALONG ALL COASTAL
WATER LEGS OF SOUTHEAST SOUTH CAROLINA.

.WATCHES/WARNINGS...
TROPICAL CYCLONE WATCHES AND WARNINGS ARE NO LONGER IN EFFECT
ANYWHERE ACROSS SOUTHEAST SOUTH CAROLINA AND SOUTHEAST GEORGIA.

PLEASE CHECK THE LATEST PUBLIC AND MARINE FORECASTS FOR DETAILED
INFORMATION ABOUT ADDITIONAL HAZARDS.

.STORM INFORMATION...
AT 3 PM EDT...THE CENTER OF TROPICAL STORM ANDREA WAS LOCATED
NEAR LATITUDE 34.9N...LONGITUDE 78.9W. THIS WAS ABOUT 160 MILES
NORTH-NORTHEAST OF CHARLESTON SC. STORM MOTION WAS NORTHEAST AT
28 MPH. STORM INTENSITY WAS 45 MPH.

.SITUATION OVERVIEW...
CONDITIONS WILL CONTINUE TO IMPROVE ACROSS THE WATERS TONIGHT AS
TROPICAL STORM ANDREA MOVES FARTHER AWAY FROM THE REGION.

.PRECAUTIONARY/PREPAREDNESS ACTIONS...
PRECAUTIONARY/PREPAREDNESS ACTIONS...

MARINERS SHOULD CHECK THE LATEST COASTAL WATERS FORECAST BEFORE
MAKING ANY DEFINITE PLANS.

&&

.NEXT UPDATE...
AS IT PERTAINS TO THIS EVENT...THIS WILL BE THE LAST LOCAL
STATEMENT ISSUED BY THE NATIONAL WEATHER SERVICE IN CHARLESTON
REGARDING THE EFFECTS OF TROPICAL CYCLONE HAZARDS UPON THE AREA.

➤ Describes
potential impacts
from the storm
as well as
appropriate
precautionary
/preparedness
actions that
should be taken

Outline

- Tropical Cyclone Hazards
- Being Prepared and Staying Informed
- **Tropical Cyclone Basics**
- Tropical Cyclone Climatology
- Tropical Cyclone History for Southeast South Carolina and Southeast Georgia

Tropical Cyclone Basics

- Tropical Cyclone: rotating system of showers and thunderstorms originating over tropical or subtropical waters and having a closed low-level circulation
- Ingredients needed for development:
 - Ocean water temperatures 80 degrees Fahrenheit or greater
 - Low amounts of vertical wind shear (i.e., winds of different strengths/directions at different heights)
 - Moist and unstable (i.e., air prone to rising) atmosphere
 - Pre-existing near-surface low pressure with sufficient spin

Tropical Cyclone Stages

- Tropical Disturbance
- Tropical Depression
- Tropical Storm
- Hurricane

- Post-tropical Cyclone: A former tropical cyclone which no longer possesses sufficient tropical characteristics but can still produce strong winds and heavy rain

Tropical Cyclone Stages

Tropical Disturbance

- No organized surface circulation
- Disorganized cluster of thunderstorms

Tropical Cyclone Stages

Tropical Depression

- Sustained winds less than 39 mph
- Surface low pressure better organized

Tropical Cyclone Stages

Tropical Storm

- Sustained winds of 39–73 mph
- Storm gets a name at this stage

Tropical Cyclone Stages

Hurricane

- Sustained winds 74 mph or greater
- Storm typically forms an “eye” at this stage

Saffir-Simpson Hurricane Wind Scale

➤ Category 1:

- 74-95 mph winds
- Minimal damage

➤ <http://hurricanes.gov/aboutsshws.php>

➤ Category 2:

- 96-110 mph winds
- Moderate damage

➤ Category 3:

- 110-129 mph winds
- Major damage

➤ Category 4:

- 130-156 mph winds
- Extreme damage

➤ Category 5:

- 157+ mph winds
- Catastrophic damage

Major hurricanes (Cat 3-5)
produce 85% of all hurricane
damage!

Note: This scale should NOT be used
to determine the amount of surge a
hurricane can produce!!

Hurricane Structure

- The eye wall surrounds the calm eye and typically contains the strongest winds
- The outer rainbands contain gusty winds, heavy rain and some tornadoes

Hurricane Observing & Forecasting

Aircraft – “Hurricane Hunters”

- NOAA P-3/Air Force Reserve WC-130
 - Samples storm environment between 500 – 10,000 feet
- NOAA Gulf Stream IV
 - Samples a large area around storm ~45,000 feet high

Hurricane Observing & Forecasting

Satellites

- *Global Network of Geostationary and Polar Orbiters*
 - Very important in hurricane analysis, tracking and forecasting

Hurricane Observing & Forecasting

NWS Land-based Doppler Radars

- Help detect storm center, max winds, and tornadoes

Hurricane Observing & Forecasting

Buoys, Ships, & Land-based Observations

Hurricane Observing & Forecasting

Weather Balloons/Radiosondes

- Released all over the world at the same time to sample the atmosphere and initialize weather forecast models
- Reach over 100,000 feet (19 miles) high
- NWS Charleston launches these balloons 2 times per day (up to 4 times per day before/during hurricanes)

Hurricane Observing & Forecasting

Forecast Models (Dynamical and Statistical)

- Used to forecast a tropical cyclone's track & strength
- As shown below, the National Hurricane Center track forecasts (left) are steadily improving, although there has been little to no improvement in intensity forecasts (right)

NHC Official Track Error Trend
Atlantic Basin

NHC Official Intensity Error Trend
Atlantic Basin

Outline

- Tropical Cyclone Hazards
- Being Prepared and Staying Informed
- Tropical Cyclone Basics
- **Tropical Cyclone Climatology**
- Tropical Cyclone History for Southeast South Carolina and Southeast Georgia

Atlantic Basin Hurricane Season

June 1 – November 30

- Atlantic basin includes most of northwest Atlantic Ocean, Caribbean Sea and Gulf of Mexico
- The peak of the season is around September 10
- However, tropical cyclones can occur before June and after November if the conditions are right

» Image courtesy of NWS/National Hurricane Center

Typical Hurricane Formation Areas/Tracks

Typical Hurricane Formation Areas/Tracks

Typical Hurricane Formation Areas/Tracks

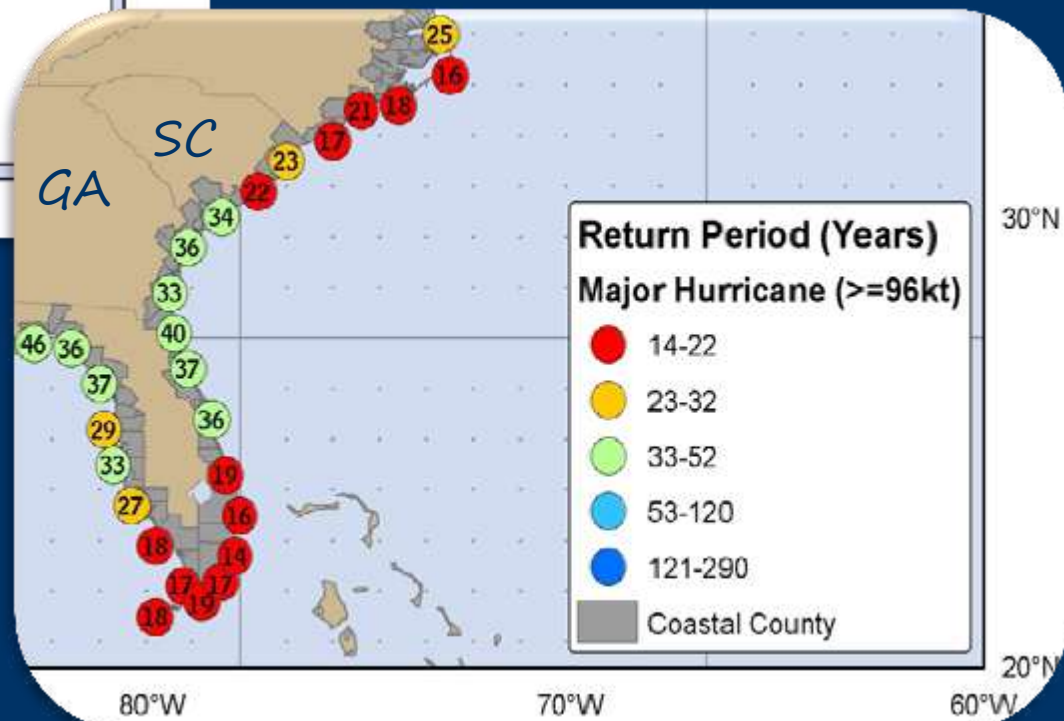

» Images courtesy of NWS/NHC

Southeast U.S. Hurricane Return Periods

➤ *Return Period*: frequency of a particular event

On average, a hurricane occurs at Charleston (Savannah) every 8 (10) years with a major hurricane at Charleston (Savannah) every 22 (36) years

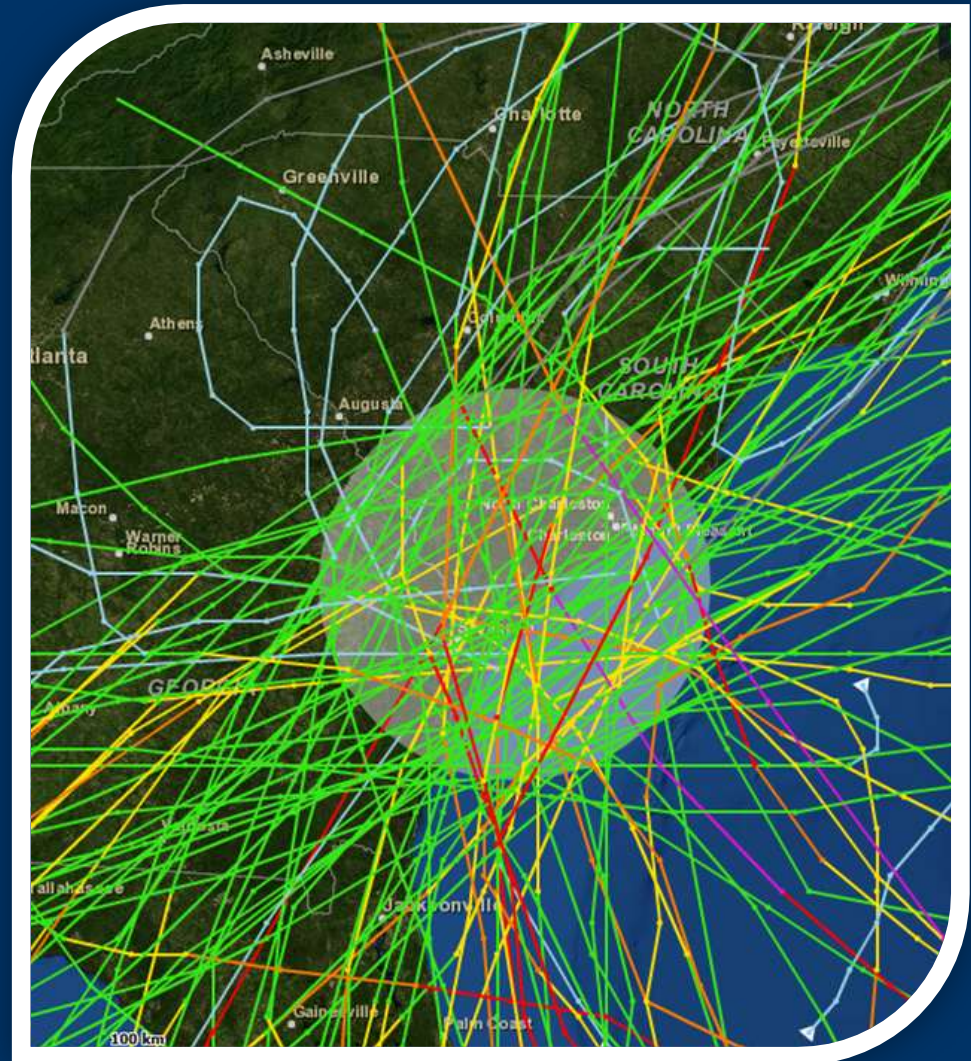

Outline

- Tropical Cyclone Hazards
- Being Prepared and Staying Informed
- Tropical Cyclone Basics
- Tropical Cyclone Climatology
- Tropical Cyclone History for Southeast South Carolina and Southeast Georgia

Local Tropical Cyclone History

<http://weather.gov/chs/TChistory>

- Since 1851 (when official records began), 91 tropical storms and hurricanes have passed within 100 miles of Beaufort, SC (see image to the right)
- Since 1851, 6 major hurricanes (Cat 3-5) have made landfall in Southeast SC/North Coastal GA
 - Unnamed - Sep 1854
 - Unnamed - Aug 1885
 - "Great Sea Islands Hurricane" - Aug 1893
 - Unnamed - Oct 1893
 - Gracie - Sep 1959
 - Hugo - Sep 1989

» Image courtesy of NOAA/Coastal Services Center

Local Tropical Cyclone History

<http://weather.gov/chs/TChistory>

- Since 1900, 30 tropical cyclones have made landfall along the South Carolina and Georgia coasts, including:
 - 2 Tropical Depressions
 - 12 Tropical Storms
 - 16 Hurricanes (including 3 Major Hurricanes as shown below)

» Images courtesy of NOAA/Coastal Services Center
